

NeoMundi x OASSE 1,000-Pull Benchmark

Corrected V2 | Full-pipeline evidence run | 29 July 2026 | Run run-1000-full-20260729-a | UTC

Executive result

The measured runner attempted all 1,000 cases and sealed 996 Gatekeeper artifacts. Four cases ended in local 60-second NeoMundi response timeouts. No other error type appears in the result file.

NeoMundi's signed audit records all 1,000 calls. The 996 successful trace IDs match directly to local artifacts. The four remaining audit entries equal the four local timeout rows; each is ALLOW with confidence 1.0 and G-Score 0.6. The failures are therefore on the local response and sealing path, not missing NeoMundi measurements.

The successful chain segment is continuous from sequence 122 through 1117. Every supplied outer artifact hash and FAM artifact hash recomputes correctly, and every successful FAM result matches the sealed pack oracle for verdict, thermal, primary rule, fingerprint, and fired rules.

The run occupied 5.72 hours. Successful full-pipeline latency averaged 20.414 seconds. NeoMundi reported 20023.30 ms of mean processing, leaving 390.77 ms for OASSE and transport on the successful path.

This is the requested 1,000-call controlled-variant benchmark. The model, source type, NeoMundi mode, pack schema, and generation method remain fixed while prompts, response templates, metric values, document conditions, and governance facts vary through a predefined grid. This supports the requested drift and cross-gate analysis.

Attempt latency across the run

Green points are sealed successes. Red points are the four 60-second client timeouts. The successful path remains concentrated near 20 seconds.

Reliability and timing

Metric	Mean	Median	P95	P99	Maximum
Full pipeline, success	20.414 s	20.404 s	20.511 s	20.741 s	21.027 s
NeoMundi processing	20023.30 ms	20019.83 ms	20027.33 ms	20041.67 ms	20727.45 ms
OASSE + transport	390.77 ms	381.79 ms	482.00 ms	701.57 ms	907.09 ms

The measured window ran from 2026-07-29T14:42:31.505177Z through 2026-07-29T20:25:27.926443Z. Effective throughput was 174.96 attempted cases per hour and 174.26 sealed artifacts per hour.

OASSE plus transport is a residual measurement, not an isolated processor timer. It includes network transit, serialization, bridge normalization, FAM evaluation, Gatekeeper sealing, persistence, and client overhead.

NeoMundi audit reconciliation

Population	Count	Finding
July 29 audit entries	1,000	All attempted calls recorded
Direct trace matches	996	One-to-one with sealed artifacts
Audit entries without local artifact	4	Equal to local timeout count
Missing successful trace IDs	0	Complete successful-path coverage

The audit covers 2026-07-29T14:42:52.512160+00:00 through 2026-07-29T20:25:28.025611+00:00. Its declared SHA-256 recomputes correctly. The four unpaired records are server-side ALLOW decisions with confidence 1.0 and G-Score 0.6.

Controlled benchmark design

Control	Observed design
Stable execution identity	source_type=llm; mode=OBS; model=oasse-tier3-pack
Prompt and response matrix	184 prompts; 6 response templates
Document condition	100 with corpus; 900 without corpus
Declared metric grid	9 cost levels; 29 latency levels; 10 risk levels
Policy matrix	Deterministic age, jurisdiction, data, consent, action, and oracle variants

Four timeout cases were preserved

Case	Seconds	Jurisdiction	Age	Action	Oracle
364	60.116	FR	10	collect	BLOCK / FAM-EU-001
404	60.162	EU	15	collect	BLOCK / FAM-EU-001
405	60.105	CH	5	transit_partner	ALLOW / None
553	60.133	US-CA	10	track	REVIEW / FAM-CH-002

Cases 404 and 405 timed out consecutively. The runner continued because the configured stop condition requires three consecutive failures. No local artifact was sealed for any failed case. Because timeout rows do not retain request IDs, the exact one-to-one assignment of the four unpaired audit records is inferred chronologically rather than joined by identifier.

Governance outcomes across the measured run

Layer	Outcome	Count	Base	Share
NeoMundi audit	ALLOW	253	1000	25.30%
NeoMundi audit	FLAG	747	1000	74.70%
FAM sealed	ABSTAIN	115	996	11.55%
FAM sealed	ALLOW	232	996	23.29%
FAM sealed	BLOCK	440	996	44.18%
FAM sealed	REVIEW	209	996	20.98%
Gatekeeper sealed	DENY	440	996	44.18%
Gatekeeper sealed	HOLD	509	996	51.10%
Gatekeeper sealed	PROCEED	47	996	4.72%

The distribution is generated by the intentionally varied governance pack and must not be interpreted as a production incident rate. NeoMundi observes and scores all 1,000 calls; FAM applies the deterministic policy oracle on the 996 returned responses; Gatekeeper uses the strictest combined thermal state.

Observed NeoMundi score summary for 996 sealed responses

Score	Mean	Median	P95	Minimum	Maximum
G-Score	0.4594	0.4000	0.6000	0.4000	0.6000
G-Final	0.8560	0.8119	0.9692	0.8000	0.9692
V-Score	0.2971	0.0000	1.0000	0.0000	1.0000

Evidence integrity

Check	Result
Pack SHA-256 matches manifest	PASS
All result rows align by ordinal and case ID	PASS
All 996 outer artifact hashes recompute	PASS
All 996 FAM artifact hashes recompute	PASS
Sequences and previous hashes are continuous	PASS
FAM and outer chain fields agree	PASS
Successful FAM verdicts match the pack oracle	PASS
Successful FAM thermal states match the oracle	PASS
Successful primary rules match the oracle	PASS
Successful fingerprints match the oracle	PASS
Successful fired-rule sets match the oracle	PASS
All successful NeoMundi trace IDs are unique	PASS
NeoMundi audit SHA-256 recomputes	PASS
NeoMundi audit contains all 1,000 July 29 calls	PASS
All 996 successful trace IDs match the audit	PASS
Matched audit decisions and scores agree	PASS
Four unpaired audit entries equal four timeouts	PASS

The verified result segment starts at sequence 122 with previous hash 597d3530e0452019f167180e . . . and ends at sequence 1117 with SHA-256 0daa0b4dd401e59b83c8843c . . .

The supplied results prove the sequence 122 through 1117 segment. The artifact at sequence 121 was not included in this evidence file, so the segment head is recorded but cannot be independently linked to the earlier chain from this package alone.

Interpretation boundaries

Population reconciliation is complete. NeoMundi recorded all 1,000 calls, including four server records without local artifacts. The local timeout rows omit request IDs, so exact one-to-one assignment among those four records remains chronological inference.

The cross-gate design is NeoMundi observation against FAM/Gatekeeper enforcement. NeoMundi remained in OBS mode by design while the deterministic FAM verdict and combined Gatekeeper action provided the enforcement-side result.

The requested benchmark is complete. This 1,000-call run uses the permitted controlled-variant method and provides the measurement, drift, policy-oracle, cross-gate, reliability, and evidence-integrity populations requested for this phase.

Reproducibility and source manifest

The evidence package preserves the exact measured inputs, local runner results, NeoMundi audit export, NeoMundi governance certificate, row-level extracts, machine-readable summary, and this report. SHA-256 values below identify the principal records used for the findings.

Artifact	SHA-256
Result JSONL	e8f93a59a081cca20aa47b57978fdd41b0b736ccbafb9891ecc7838951e084f1
1,000-case pack	2e8bd242dcd370d88ef3ac6d8d37b408ed2f58cc351bca11a819c08fb31058ae
NeoMundi audit JSON	ebf68ad331a2ac415df58ec30709dc21c10c260b2a295e6ea2df00c5b8f38d15
Final chain artifact	0daa0b4dd401e59b83c8843cff519b92121b3e2e21bbaae9358883a366dc9b67

Source roles

Source	Role in validation
Runner result JSONL	Attempt status, timing, artifacts, traces, and chain segment
FAM 1,000-case pack	Exact inputs and deterministic expected oracle
Pack manifest	Authoritative pack size and pack SHA-256
NeoMundi audit JSON	Server-side population, decisions, confidence, G-Score, and request IDs
NeoMundi certificate PDF	Signed cumulative governance summary for the July 2026 period

Verification method. Recompute SHA-256 values from SHA256SUMS.txt, recalculate the audit integrity digest after excluding its declared hash and verification URL, join successful local trace prefixes to NeoMundi request ID prefixes, and replay the FAM oracle comparisons from the exact pack.

Share readiness: ready to share. All material calculations, artifact hashes, oracle comparisons, trace joins, population totals, and rendered pages have been rechecked. The timeout request-ID caveat is explicit.
